Notes:

All of our software does not include any third party programs or any hardware components

1. 1 line modem based caller ID interface: Each computer can monitor only 1 telephone line with an internal US Robotics/3COM modem with hardware based caller ID. Each line will be considered separate, and the information will not consolidate.

2. Delivery map code lookup support: Customer needs to input the map codes into the software first.

3. Delivery visual map display interface: Customer needs to have Microsoft Streets & Trips 2001-2004 already installed and running on the specific computer.

4. Video Surveillance Snapshot Support: Customers need to have a webcam compatible digital camera already working on the system. Snapshot monitoring is limited to the software design scope.

5. Up to 8 line caller ID monitoring interface: The YES-TELE caller ID box must already be installed and configured for the interface to work.

6. This ability is accomplished through the required full version.
